Consumer Confidence Report

June 2024 – May 2025

Rated “Green”, as good as it gets

Last year our water again met or exceeded all drinking water standards set by the State and EPA.

Source protection information

The Department of Health has compiled Source Water Assessment Program (SWAP) data for every community public water system in Washington. View SWAP data for the Valleyhi Water System (fortress.wa.gov, search for system #90975). Enter our system's name, *Valleyhi Community Club*, and ID **#90975** to see our information.

Our water comes from two wells near Allen Lane, about 300 feet northeast of the Fire Department.

The current assessment shows no significant susceptibility to potential sources of contamination, and we are classified in the “Green” category (as good as it gets). Water is sampled monthly for coliforms, which can signal the need for further sampling. All samples are coming back satisfactory, and any results to the contrary will be posted on this website.

We also sample for nitrates. The State Reporting Level is 2.0, and the Maximum Contaminant Level is 10 mg/L. Our water remains below that level. We also tested for disinfection by-products in 2023, as the State requires. Those tests came back satisfactory; in fact, none were detected.

Past years' sampling results are in the state database (search for water system #90975). You can also request data by emailing the water distribution manager at h2oconnectionsnw@yahoo.com.
